

1. **Schema** : The schema used for sales analytics in the file provided_schema.sql
2. **Index**: Index used and reason for index creation : In file provided_schema.sql
3. **JSP used** : sales_analytics.jsp.
4. Other servlet and Java code : AnalyticsTableEntry.java. , SalesAnalyticsHandler.java
5. **Postgres Functions Created**:
 1. generate_report_customers. This function is defined in cutomers_correlated.sql.
 2. generate_report_states. This function is defined in generate_report_states.sql

Our approach is to do all processing in the database and we do not do any processing in java/jsp side. Jsp is only used to show the results.
